

Component Resolution Support

BAE Systems' **Component Resolution Support** is a service that works within **AVCOM** and beyond, providing assistance in locating aftermarket inventory, potential alternate parts and possible vendors. What started as a group of individuals selected to support special projects for our V-22 customer has grown into a powerful investigative team called the **Component Resolution Group (CRG)**. The **CRG** utilizes their vast contacts within the component manufacturing, vendor and wholesaling industries in order to provide the information necessary to sustain system life cycles. The **CRG's** service is not limited to just those items loaded in **AVCOM**; they can also provide support for items not loaded in **AVCOM**.

This is especially helpful as obsolescence issues can arise at any moment on a variety of items; from diodes to connectors and from system boxes to screws. If existing stock can not be located, the **CRG** provides a "market analysis" of potential new manufacturing sources ensuring those potential manufacturers are willing and able to do business with the Government. This saves the Government Engineers and Equipment Specialists valuable time and provides them with the information they need to make informed decisions regarding the health of the systems they manage.

The power to avoid unnecessary obsolescence redesign due to non-availability of components is at your finger tips.
